

Platform. SMS Notification Mechanism.

Version 1.0

Date: 8 March 2014

Platform. SMS Notification Mechanism Setup

The Protectimus platform allows you to choose an SMS aggregator to send one-time passwords and notifications to your users and employees.

To send SMS messages, you need to implement a simple mediator that will receive messages from the platform and send them to the aggregator chosen by you.

Be sure to enter your mediator's address for sending SMS messages in the platform's settings (click on your username in the upper right corner of your platform, then select Settings from the drop-down list).

The Protectimus platform will send requests to the address specified by you to send SMS messages with the specified phone and message parameters, which will mean the phone number and the message that needs to be sent.

For example, if you specified this address: <http://localhost:8080/sms-gateway>, and the platform needs to send an SMS message with the text 'Hello' to this number: +12345678, the following call will be made: <http://localhost:8080/sms-gateway?phone=+12345678&message>Hello>
