# Mass User Protection in a Short Time

## PROTECTIMUS SMS

Protectimus SMS allows you to turn any mobile phone into an authentication device. Every time a user logs in at your website, he/she will receive an SMS-message containing a one-time password. Using this token saves you time and effort.

These tokens are used on a paid basis. A fee is charged for the services of message delivery operators. We make every possible effort to offer the lowest prices and make this tool even more convenient and affordable for you.

## Simplicity of Service

This option does not require issuing and servicing tokens; no additional equipment or settings are necessary. Users are familiar with the practice of verifying their identity with codes that they receive over the phone, which means that you will not need to train users and explain why it is necessary.

## Wide Applicability

This type of token is ideal for systems where users change frequently, or systems for which other types of tokens are not a good option for various reasons.

## Key Features

- Password delivery via SMS-messages;
- Convenient use;
- Maximum audience reached;
- No additional user instructions are necessary;
- A phone number is sufficient for creating a token.
